RESEARCH INTERESTS

- **Debris Disk Incidence and Characterization:** To assess the frequency of planetary system formation by investigating circumstellar planetary debris disks of dust, characterized by infrared excesses over photospheric levels, and by studying their spectral energy distributions (SEDs) to investigate their dust spatial distribution, chemical composition, and evolution.
- **Debris Disk Modeling:** To advance our understanding of disk architecture and grain properties, by modeling the SEDs of circumstellar dust around main sequence stars using spectroscopic and photometric data.
- **High-Contrast Imaging:** To search for dust-shepherding exoplanets using the Adaptive Optics systems at Keck II Observatory in HI, and Palomar Observatory in CA.
